Overview

Pricing tables play an important role for every company that offers products or services. They are a challenge from both a design and usability standpoint. They must be simple but at the same time clearly differentiate between features and prices of different products and services.

Introduction

Pricing tables play an important role for every company that offers products or services. They are a challenge from both a design and usability standpoint. They must be simple but at the same time clearly differentiate between features and prices of different products and services.

A pricing table **should help users pick the most appropriate plan for them**. A company should carefully examine its product portfolio and pick the most important features to present in its pricing plans. Visitors should be given only the information they would be interested in: available features, options and costs. The rule of thumb is: every unnecessary cell in your pricing table increases the probability of losing potential customers, because you make it more difficult for them to compare various plans and select the best one.

Once you have identified the most important features, go ahead and create a more detailed list of features for users who are interested in a particular plan. Users must know what kind of a product they are spending their money on and all of the features associated with it.
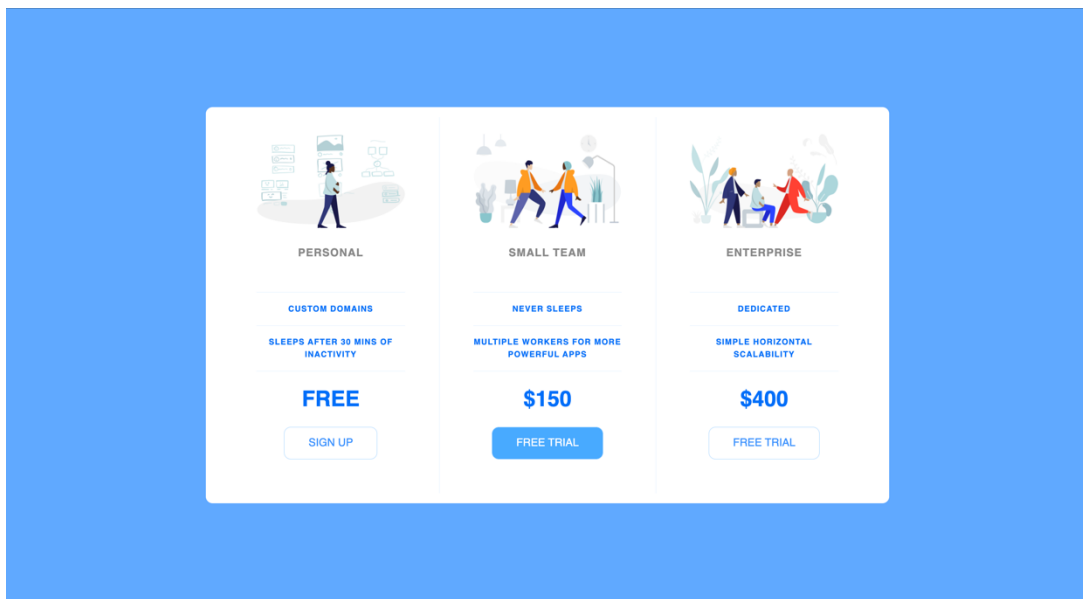

Tools Used

- o HTML
- o CSS

Features

- o User Friendly
- o It contains a interactive UI which allows user to control.
- o It help users pick the most appropriate plan for them.
- o Explains different product portfolio and pick the most important features.
- o Helps to pick important features.
- o list of features for users who are interested in a particular plan.

Code Analysis

- o First, we created a panel class using <div> to keep whole code in that class for better efficiency.

- o Then inside different div tag I created different planes inside it. And gave them different class so we can design it

- o Inside each div we have inserted different images, h2 header value, using "ul" Tag we are showing features

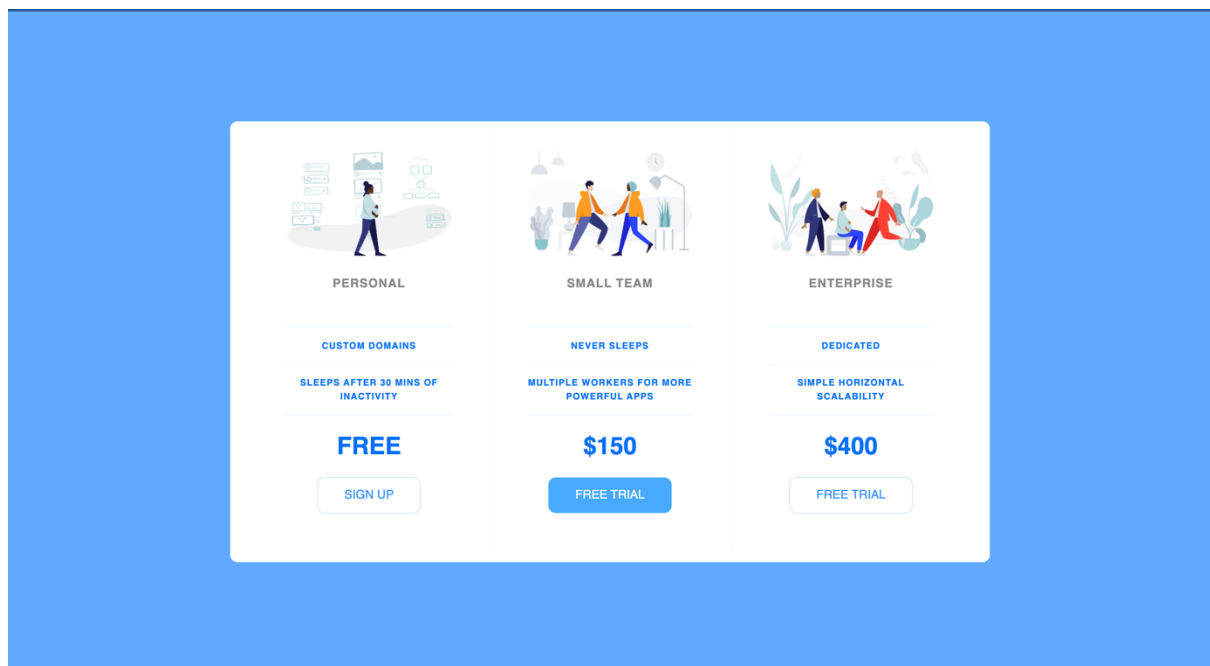

- o Used "a" tag and added a class so we can make it as a button and add. hover effect.

- Using CSS I styled the Website into attractive.
- Using **<link rel = "stylesheet" href = "style.css">** i have linked the CSS file with HTML file.
- In CSS stylesheet I have used display, font, background, margin, padding, opacity. Transition and cursor tags to look website more attractive.

Snapshots

Conclusion

This website is useful for company that offer different product

And want to make it easy for the costumers understand the product

Features care fully according to their needs.
